A 10-Year Retrospective and Prospective Assessment of Trends: Electricity Supply and Demand and Associated Water Consumption in the Great Lakes St. Lawrence Region

#### 5/29/25 Webinar

#### Susan Fancy, Managing Director sfancy@umich.edu

DOI 10.7302/25796 (DOI for the report)

### Study: Questions Asked by GSGP

How much electricity is generated in the Region, and what is the fuel mix including renewables such as wind, hydroelectric, and solar?

How is the Region meeting its renewable energy demand? Local production or by importing from other areas to fulfill state-and provincial-level clean energy targets?

What is the net import or export of electricity into or from the Region, and what are the main sources? Is there a surplus of energy that could support the development of new industries and future growth? Which states or provinces are the largest exporters?

Over the next decade, what are the projected changes in electricity consumption, fuel mix, and water usage under various scenarios?

#### Key Study Conclusions: 2014 to 2023 Timeframe

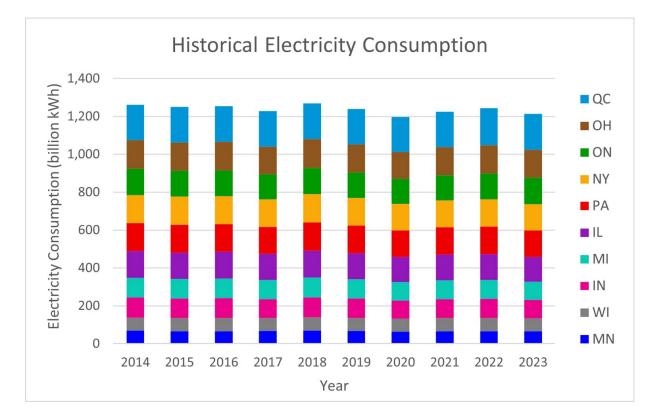

- With the Region's shift from coal and nuclear to gas, solar and wind, energy production has been significantly decarbonized and uses less water, while supporting an increase in regional real GDP
- The region is exporting an excess of 5.7% of total electricity generated. If used to support mid-sized data centers at 50 MW, there is capacity for 181 in the Region
- Water consumption has decreased 24%
- The dual benefit of more efficient energy production and decreased water use offers **new potential** economic opportunities for the Region - continue to export and sell power? Or use it for new purposes? Data centers, polysilicon for usage in solar and electronics, or product manufacture that use waste carbon dioxide as a feedstock are just a few possibilities

#### Major Transmission Lines of North America

Source: <u>CER: International Power</u> Lines and the Canada-U.S. Grid

#### Future Projection of Electricity Consumption *High, Medium and Low Economic Growth Scenarios*

#### Drivers behind increases:

- Building electrification
- Electric vehicles
- New industries such data centers and chip manufacturing
- Province-and-state-specific loads, such as more greenhouses in Ontario
- Population growth

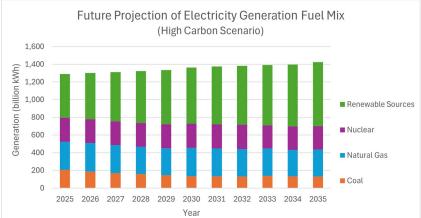

Data source: <u>Power Trends - NYISO</u> MISO 2024 Load Forecast and Process Enhancements Workshop <u>Report: Transmission Planning for PJM's Future Load and</u> <u>Generation</u> <u>Annual Planning Outlook</u> <u>Action Plan 2035 | Hydro-Québec</u>

# Future Projection of Electricity Generation Fuel Mix: Scenarios

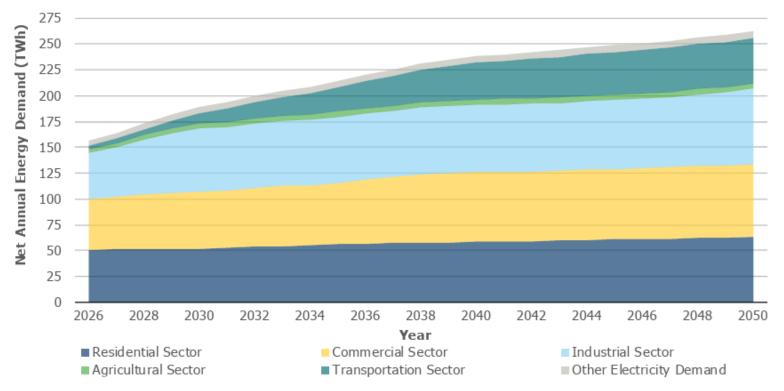

Year

Differences in low, medium and high scenarios are due to the proportion of clean energy sources in the fuel mix and the related level of carbon emissions

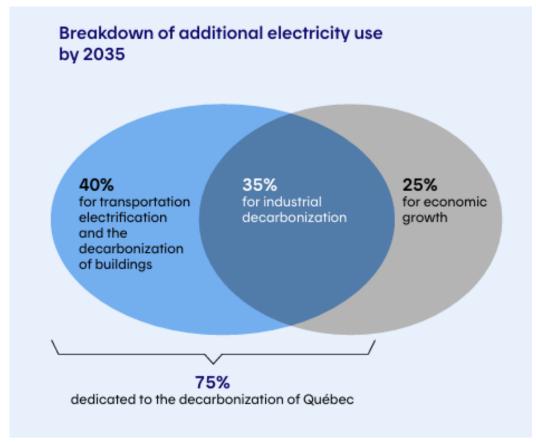

# Example of Future Electricity Demand Drivers: Ontario

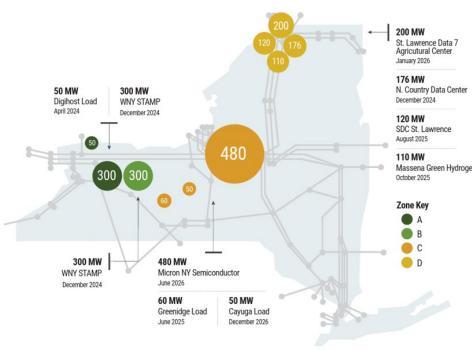

#### Source: IESO Annual Planning Outlook

#### Example of Future Electricity Demand Drivers: Québec

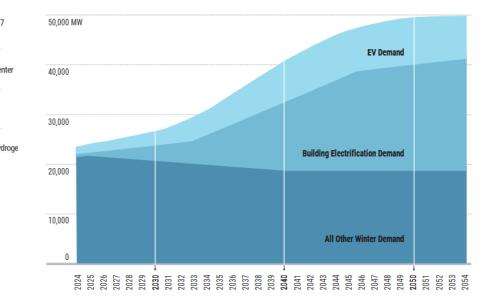

# Example of Future Electricity Demand Drivers: NY

#### NEW LARGE LOAD PROJECTS IN NEW YORK STATE

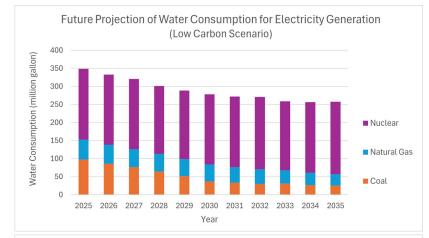

#### EXPECTED IMPACT OF ELECTRIFICATION ON STATEWIDE WINTER PEAK DEMAND (MW)

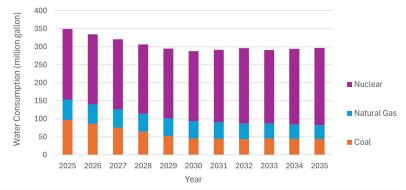

Data source: Power Trends - NYISO

# Future Projection of Water Consumption: Scenarios

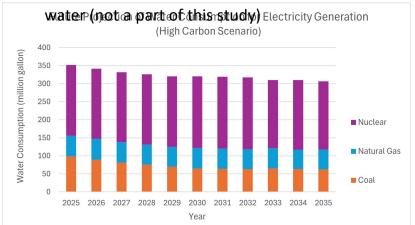

Future Projection of Water Consumption for Electricity Generation (Medium Carbon Scenario)

Differences in low, medium and high scenarios are due to the proportion of clean energy sources in the fuel mix and the related level of carbon emissions

Note that renewable energy sources do not generate consumptive water losses

#### Data centers typically use large amounts of cooling

#### Additional Study Conclusions

- Energy consumption for the Region over the last 10 years has been largely stable, while province and state level real GDP has grown. Energy consumption for the Region has remained relatively flat within year to year variability, ranging from 1,262 billion kWh in 2014 to 1,213 kWh in 2023. Over the same timeframe, GDP for Ontario, Québec, and the U.S. Great Lakes States increased in the low single digit percentages annually, typically 1-4%. Net GDP gains for the decade include a 2020 decrease in GDP from covid
- Significant opportunities exist for additional low to zero emission energy generation in wind, solar, and anaerobic digestion to produce either natural gas or electricity
- For energy storage, there is also significant capacity for pumped hydro systems\*, although these would need to account for complexities in siting on highly desirable shoreline, availability of supporting infrastructure and community receptivity

\*Pumped hydroelectric storage is a method of storing energy by using surplus electricity when available to pump water from a lower reservoir to a higher reservoir, then releasing the water through turbines to generate electricity later on. It's essentially a "water battery" that can be charged and discharged to balance electricity supply and demand. The Ludington Michigan plant, built in 1973, is 2,172 MW capacity

#### Example of Future Electricity Demand Drivers: MISO (Midwest US)

The Series 2 load growth assumptions represent a key driver for the new Futures series; these are based on the data discussed in the December 2024 load forecasting workshop

	Lower Loa	d Growth	Stated	d Policy	Higher Lo	oad Growth	Supply Shift
	FUTU	JRE 1	FUT	URE 2	FUTU	IRE 3	FUTURE 4
	Series 1 & 1A	Series 2 (New)	Series 1 & 1A	Series 2 (New)	Series 1 & 1A	Series 2 (New)	Series 2 (New)
Load Growth	Consistent with current trends (0.35% CAGR)	Consistent with low-end projections (1.1% CAGR)	30% energy increase (0.8% CAGR)	Consistent with anticipated values (1.6% CAGR)	50% energy increase (1.1% CAGR)	Consistent with high-end projections (2.1% CAGR)	Consistent with anticipated values (1.6% CAGR) – additional Demand Response if needed

Assumption Variables											
FUTURE 1	FUTURE 2	FUTURE 3	FUTURE 4								
Account for a modest driver growth that aligns to reduced technology adoption patterns in building electrification and electric vehicles	Account for technology adoption trends, existing policy incentives and an increase in data centers, domestic manufacturing and green hydrogen facilities	Accelerated electric vehicle adoption and additional buildouts of data centers, domestic manufacturing and green hydrogen facilities	Future 2 load growth with use of additional demand response if needed								

# Example of Future Electricity Demand Drivers: MISO (Midwest US)

Macroeconomics have expanded since MISO's Futures 1A report to include not only EVs and Building Electrification but also data center AI revolution, domestic manufacturing and green hydrogen

# State/Province Renewable Portfolio Standards (RPS) [1] [2]

• **Ontario** has no official RPS goal, but instead aims to reduce greenhouse gas emissions by 80% below 1990 levels by 2050 <sup>[8]</sup>

• Québec aims for 100% renewable energy use in buildings by 2040 <sup>[9]</sup>, and plans to achieve net-zero greenhouse gas emissions by 2050 <sup>[10]</sup>

 $\cdot$  Illinois aims to achieve 40% of its energy from renewable sources by 2030, 50% by 2040, and 100% clean energy by 2050  $^{[5]}$ 

 $\cdot$  Indiana has no official clean energy goal, but instead has a voluntary<sup>b</sup> target of 10% clean energy by 2025 <sup>[1]</sup>

• Michigan has a clean energy standard of 80% by 2035 and 100% by 2040 [4]

• **Minnesota** aims for 55% renewable energy under its RPS by 2035 <sup>[1]</sup>, along with carbonfree electricity targets of 80% by 2030, 90% by 2035, and 100% clean energy by 2040 <sup>[2]</sup> <sup>[7]</sup>

# State/Province Renewable Portfolio Standards (RPS) [1] [2]

• **New York** sets nation-leading goals for achieving 70% renewably sourced electricity by 2030 and a zero-emission electric grid by 2040 <sup>[3]</sup>

• **Ohio** has no official clean energy goal, but instead has a target of 8.5% alternative<sup>*a*</sup> energy 2026 <sup>[1]</sup>

• **Pennsylvania** has no official clean energy goal, but instead has a target of 18% alternative<sup>a</sup> energy by 2020–2021 <sup>[1]</sup>

• Wisconsin aims to be 100% carbon-free in electricity by 2050 [6]

<sup>a</sup> Alternative Energy Resource Standard <sup>b</sup> Voluntary Clean Energy Portfolio Standard Program
